

# 10MHz, 6V/ $\mu$ s, Dual Rail-to-Rail Input and Output Precision C-Load Op Amp

## DESCRIPTION

The RH1498 is a dual, rail-to-rail input and output precision C-Load™ op amp with a 10MHz gain-bandwidth product and a 6V/ $\mu$ s slew rate.

The RH1498 is designed to maximize input dynamic range by delivering precision performance over the full supply voltage. Using a patented technique, the input stages of the RH1498 are trimmed, one at the negative supply and the other at the positive supply. The resulting guaranteed common mode rejection is much better than other rail-to-rail input op amps. When used as a unity-gain buffer in front of single supply 12-bit A-to-D converters, the RH1498 is guaranteed to add less than 1LSB of error even in single 3V supply systems.

With 110dB of supply rejection, the RH1498 maintains its performance over a supply range of 2.2V to 36V. The inputs can be driven beyond the supplies without damage or phase reversal of the output. These op amps remain stable while driving capacitive loads up to 10,000pF.

The wafer lots are processed to Linear Technology's in-house Class S flow to yield circuits usable in stringent military and space applications.

LT, LTC and LT are registered trademarks of Linear Technology Corporation. C-Load is a trademark of Linear Technology Corporation.

## ABSOLUTE MAXIMUM RATINGS

(Note 1)

Total Supply Voltage ( $V^+$ to $V^-$ ) .....	36V
Input Current .....	$\pm 10\text{mA}$
Output Short-Circuit Duration (Note 2) .....	Continuous
Operating Temperature Range .....	$-55^\circ\text{C}$ to $125^\circ\text{C}$
Specified Temperature Range .....	$-55^\circ\text{C}$ to $125^\circ\text{C}$
Junction Temperature .....	$150^\circ\text{C}$
Storage Temperature Range .....	$-65^\circ\text{C}$ to $150^\circ\text{C}$
Lead Temperature (Soldering, 10 sec) .....	$300^\circ\text{C}$

## BURN-IN CIRCUIT

## PACKAGE INFORMATION

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** A heat sink may be required to keep the junction temperature below this absolute maximum rating when the output is shorted indefinitely.

**Note 3:** Matching parameters are the difference between amplifiers A and B.

**Note 4:** Output voltage swings are measured between the output and power supply rails.

## TABLE 2: ELECTRICAL TEST REQUIREMENTS

MIL-STD-883 TEST REQUIREMENTS	SUBGROUP
Final Electrical Test Requirements (Method 5004)	1*,2,3,4,5,6
Group A Test Requirements (Method 5005)	1,2,3,4,5,6
Group B and D for Class S, and End Point Electrical Parameters (Method 5005)	1,2,3

\* PDA applies to subgroup 1. See PDA Test Notes.

### PDA Test Notes

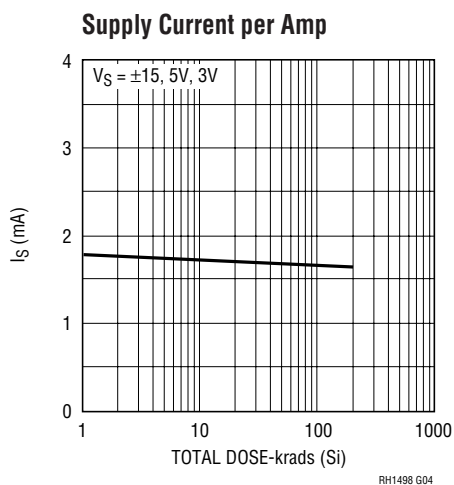

The PDA is specified as 5% based on failures from group A, subgroup 1, tests after cooldown as the final electrical test in accordance with method 5004 of MIL-STD-883. The verified failures of group A, subgroup 1, after burn-in divided by the total number of devices submitted for burn-in in that lot shall be used to determine the percent for the lot.

Linear Technology Corporation reserves the right to test to tighter limits than those given.
